A Handbook of Statistical Analyses Using R

Brian S. Everitt and Torsten Hothorn

CHAPTER 10

Analysing Longitudinal Data I: Computerised Delivery of Cognitive Behavioural Therapy–Beat the Blues

10.1 Introduction

10.2 Analysing Longitudinal Data

10.3 Analysis Using R

We shall fit both random intercept and random intercept and slope models to the data including the baseline BDI values (`pre.bdi`), `treatment` group, `drug` and `length` as fixed effect covariates. Linear mixed effects models are fitted in R by using the `lmer` function contained in the *lme4* package (Bates and Sarkar, 2006, Pinheiro and Bates, 2000, Bates, 2005), but an essential first step is to rearrange the data from the 'wide form' in which they appear in the `BtheB` data frame into the 'long form' in which each separate repeated measurement and associated covariate values appear as a separate row in a *data.frame*. This rearrangement can be made using the following code:

```
R> data("BtheB", package = "HSAUR")
R> BtheB$subject <- factor(rownames(BtheB))
R> nobs <- nrow(BtheB)
R> BtheB_long <- reshape(BtheB, idvar = "subject",
+      varying = c("bdi.2m", "bdi.4m", "bdi.6m", "bdi.8m"),
+      direction = "long")
R> BtheB_long$time <- rep(c(2, 4, 6, 8), rep(nobs, 4))
```

such that the data are now in the form (here shown for the first three subjects)

```
R> subset(BtheB_long, subject %in% c("1", "2", "3"))
```

```
     drug length treatment bdi.pre subject time bdi
1.2m   No    >6m       TAU      29       1    2   2
2.2m  Yes    >6m     BtheB      32       2    2  16
3.2m  Yes    <6m       TAU      25       3    2  20
1.4m   No    >6m       TAU      29       1    4   2
2.4m  Yes    >6m     BtheB      32       2    4  24
3.4m  Yes    <6m       TAU      25       3    4  NA
1.6m   No    >6m       TAU      29       1    6  NA
2.6m  Yes    >6m     BtheB      32       2    6  17
3.6m  Yes    <6m       TAU      25       3    6  NA
1.8m   No    >6m       TAU      29       1    8  NA
2.8m  Yes    >6m     BtheB      32       2    8  20
3.8m  Yes    <6m       TAU      25       3    8  NA
```

The resulting *data.frame* `BtheB_long` contains a number of missing values

```
R> data("BtheB", package = "HSAUR")
R> layout(matrix(1:2, nrow = 1))
R> ylim <- range(BtheB[,grep("bdi", names(BtheB))],
+                na.rm = TRUE)
R> tau <- subset(BtheB, treatment == "TAU")[,
+      grep("bdi", names(BtheB))]
R> boxplot(tau, main = "Treated as usual", ylab = "BDI",
+          xlab = "Time (in months)", names = c(0, 2, 4, 6, 8),
+          ylim = ylim)
R> btheb <- subset(BtheB, treatment == "BtheB")[,
+      grep("bdi", names(BtheB))]
R> boxplot(btheb, main = "Beat the Blues", ylab = "BDI",
+          xlab = "Time (in months)", names = c(0, 2, 4, 6, 8),
+          ylim = ylim)
```

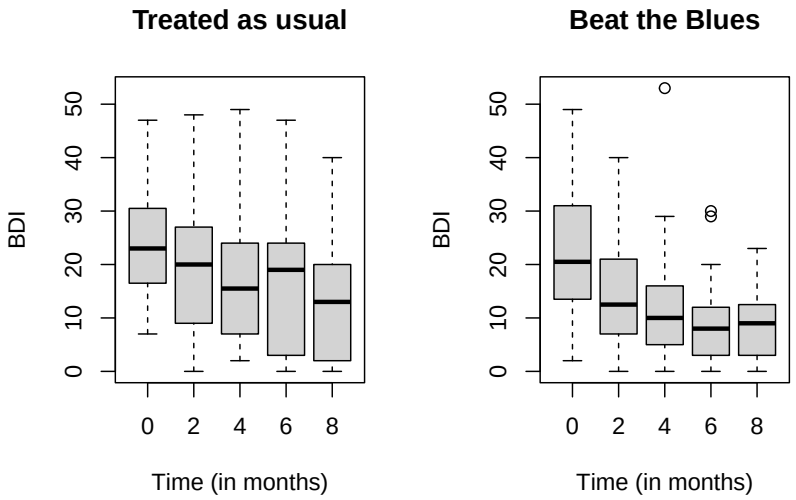

Figure 10.1 Boxplots for the repeated measures by treatment group for the `BtheB` data.

and in applying the `lmer` function these will be dropped. But notice it is only the missing values that are removed, *not* participants that have at least one missing value. All the available data is used in the model fitting process. The `lmer` function is used in a similar way to the `lm` function met in Chapter **??** with the addition of a random term to identify the source of the repeated measurements, here `subject`. We can fit the two models (**??**) and (**??**) and test which is most appropriate using

```
R> library("lme4")
```

```
R> BtheB_lmer1 <- lmer(bdi ~ bdi.pre + time + treatment + drug +
+      length + (1 | subject), data = BtheB_long,
+      REML = FALSE, na.action = na.omit)
R> BtheB_lmer2 <- lmer(bdi ~ bdi.pre + time + treatment + drug +
+      length + (time | subject), data = BtheB_long,
+      REML = FALSE, na.action = na.omit)
R> anova(BtheB_lmer1, BtheB_lmer2)
Data: BtheB_long
Models:
BtheB_lmer1: bdi ~ bdi.pre + time + treatment + drug + length + (1 | subject)
BtheB_lmer2: bdi ~ bdi.pre + time + treatment + drug + length + (time | subject)
            npar    AIC    BIC  logLik deviance  Chisq Df
